DESCRIPTIONS OF FIVE NEW INDO-CHINESE BIRDS

BY OUTRAM BANGS AND JOSSELYN VAN TYNE

The five birds here named were secured by the members of the William V. Kelley-Roosevelts Asiatic Expedition of Field Museum of Natural History, Chicago, the Indo-China division of the expedition being under the leadership of Harold J. Coolidge, Jr. The large collection of birds obtained on this expedition is in our hands and we hope soon to publish a detailed account of it in a later number of Field Museum publication.

The present paper is a preliminary one containing only descriptions of some new forms.

Garrulax erythrocephalus hendeei subsp. nov.

_Characters._—Of the eight forms that Stuart Baker (Fauna British India) considers geographical races of _Garrulax erythrocephalus_ the new form needs comparison only with _melanostigma_ Blyth, from which it differs in having the back slightly grayer, the throat duller reddish brown, and the sides of the neck and the entire chest strongly "scaled"—the feathers of these regions having pale gray edges and dusky centers. Wing of type, 95; tail, 97 mm.

This well-marked form is named for the able young naturalist Russell W. Hendee, whose death of tropical fever was a sad blow to his fellow members of the expedition.

Cursonia crispifrons saxatilis subsp. nov.

_Type_ from Nam Na River at Bac Tan Trai, Tonkin. No. 68008 Field Museum of Natural History. Adult male. Collected February 26, 1929, by J. Van Tyne. Orig. No. 430.

_Characters._—Diffsers from _Cursonia crispifrons crispifrons_ (Blyth) of the limestone ranges of Tenasserim in being gray in general coloration instead of olive brown. Upper parts grayish olive brown, the dark edges of the feathers deep black. Lower parts: throat white, heavily striped with deep black, breast and belly dark gray. Wing, 75; tail, 74 mm.
This very gray and black form was found only on the limestone hills whence came the type. Several were shot there by Mr. Coolidge but all but the type were lost in the holes in the rocks into which they fell.

**Schoeniparus rufogularis kelleyi** subsp. nov.

*Characters.*—A very distinct form, differing sharply from *S. r. major*, *S. r. blanchardi*, and *S. r. stevensi* in having the throat band broader and deep chestnut in color—very much darker than in any of the other known forms. The head and whole upper parts are much darker than in any of the other races. Wing of type, 66; tail, 50 mm.

Named for Mr. William V. Kelley, who financed the expedition.

**Alcipponis piocephala alearis** subsp. nov.

*Type* from Muong Moun, Tonkin. No. 68010 Field Museum of Natural History. Adult male. Collected March 29, 1929, by J. Van Tyne. Orig. No. 921.

*Characters.*—Most nearly like *Alcipponis p. magnirostris* (Walden) and as in that form with sooty brown coronal stripes and grayish brown head (thus differing from *Alcipponis p. haringtoniae* Hartert). From *Alcipponis p. magnirostris* the new form differs in its darker, less olive brown back; duller, less cinnamon-rufous rump and outer edges of wing feathers; and in its more cinnamon-rufous under parts. Wing of type, 67; tail, 60 mm.

**Phylloscopus pernotus** sp. nov.

*Characters.*—Somewhat similar to *Phylloscopus trivirgatus ricketti* (Slater) but smaller, and breast and belly white instead of yellow.

Upper parts rather duller olive green than in *Phylloscopus t. ricketti* and dark head stripes duller—olivaceous dusky instead of black. Lower parts very different; throat and under tail coverts yellow, breast and belly white, becoming grayish on sides. Wing, 50; tail, 35.5 mm. (the wing in a long series of *Phylloscopus t. ricketti* measures 53 to 56 mm.).
